Mathematical Model

All cardiac cell models in tissue are reaction-diffusion equations.

$$C_{\mathrm{m}} \frac{\partial V(t,\mathbf{x})}{\partial t} = \nabla \cdot (D(\mathbf{x}) \nabla V) - I_{\mathrm{ion}}(V,\mathbf{m}) - I_{\mathrm{stim}}(t,\mathbf{x})$$

$$\frac{\partial \mathbf{m}(t,\mathbf{x})}{\partial t} = \mathbf{f}(V,\mathbf{m})$$

Cell Modeling (Continuum Mathematical Model)

Nonlinear parabolic reaction-diffusion equations:

$$C_{\mathrm{m}}\partial_t V(t,\mathbf{x}) = \nabla\cdot(D(\mathbf{x})\nabla V) - I_{\mathrm{ion}}(V,\mathbf{m}) - I_{\mathrm{stim}}(t,\mathbf{x})$$
$$\partial_t \mathbf{m}(t,\mathbf{x}) = \mathbf{f}(V,\mathbf{m})$$

$V(t,\mathbf{x})$ membrane potential

$\mathbf{m}(t,\mathbf{x})$ gating variables, ionic concentrations

C_{m} membrane capacitance

D(x) conductivity tensor

Iion total ionic current across the membrane of the cell

Istim external stimulus current

Neumann boundary conditions on potential V:

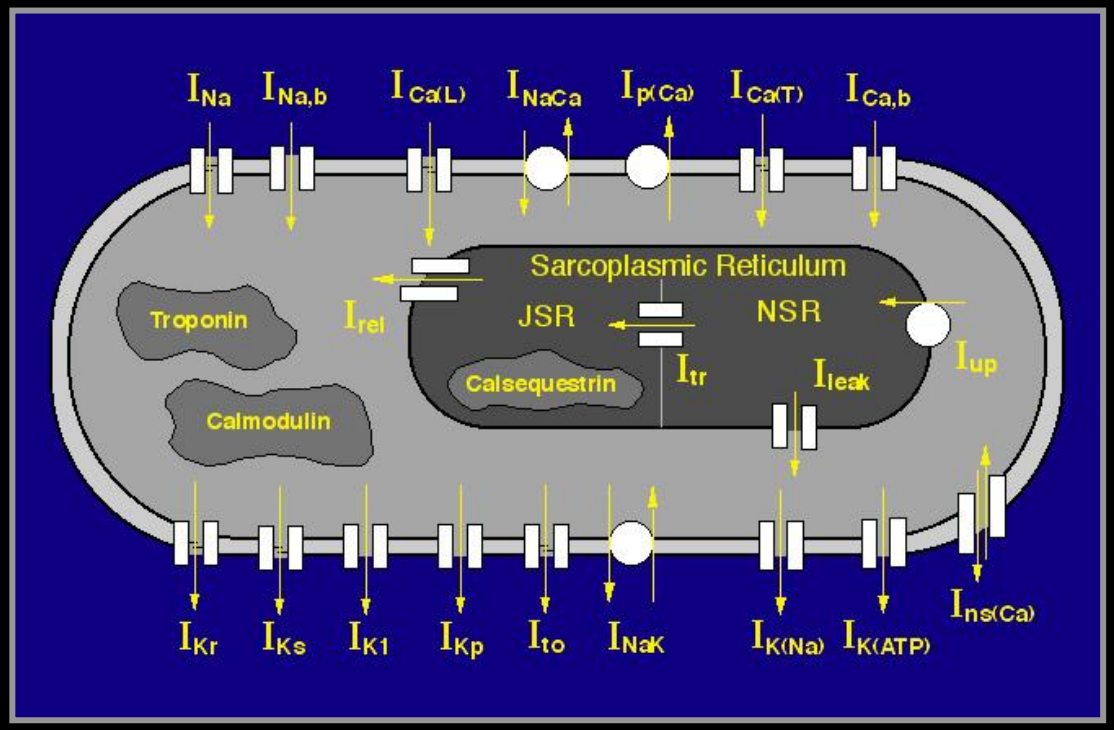
$$n\cdot\nabla V = 0$$

Continuum Mathematical Model

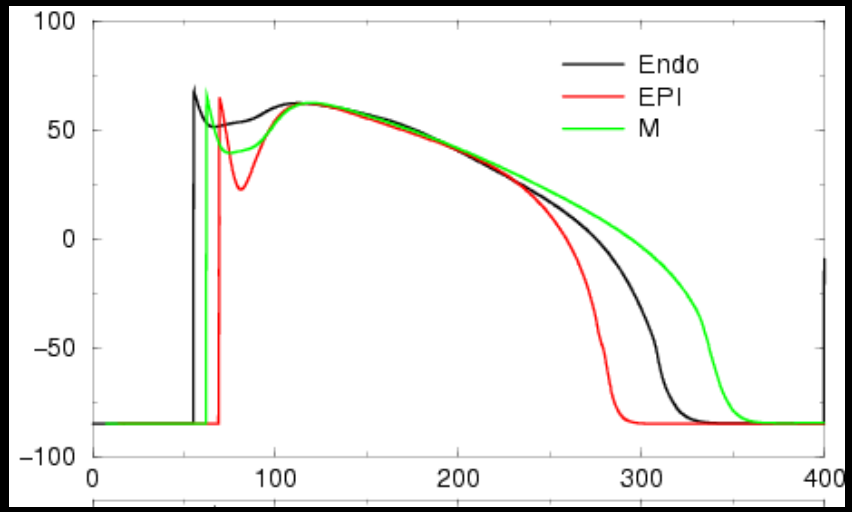
Nonlinear parabolic reaction-diffusion equations:

$$C_{\mathrm{m}}\partial_t V(t,\mathbf{x}) = \nabla\cdot(D(\mathbf{x})\nabla V) - I_{\mathrm{ion}}(V,\mathbf{m}) - I_{\mathrm{stim}}(t,\mathbf{x})$$

$$\partial_t \mathbf{m}(t,\mathbf{x}) = \mathbf{f}(V,\mathbf{m})$$



AP shape depends on the currents



Continuum Mathematical Model

Nonlinear parabolic reaction-diffusion equations:

$$C_{\mathrm{m}}\partial_t V(t,\mathbf{x}) = \nabla\cdot(D(\mathbf{x})\nabla V) - I_{\mathrm{ion}}(V,\mathbf{m}) - I_{\mathrm{stim}}(t,\mathbf{x})$$
$$\partial_t \mathbf{m}(t,\mathbf{x}) = \mathbf{f}(V,\mathbf{m})$$

Examples of differences in cardiac cell models of same type

Three comparisons

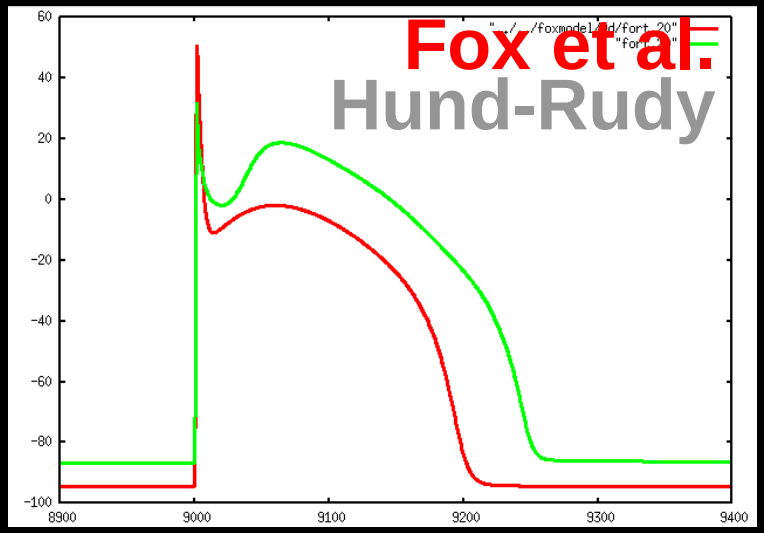
Comparing two canine cell models

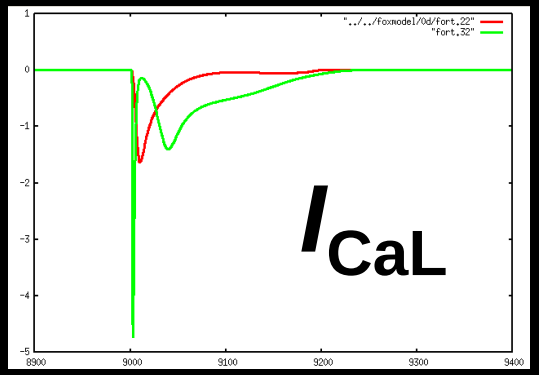
Two ionic models of canine ventricular myocytes:

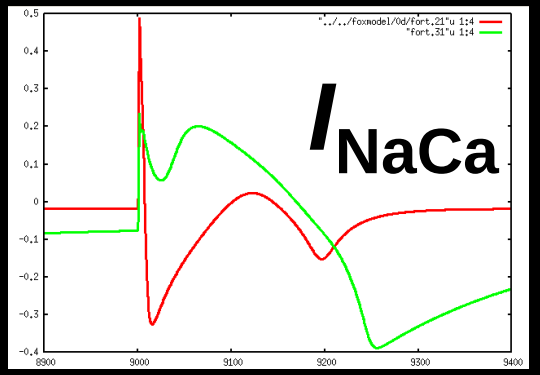
- Fox et al., 2002:
  - 13 variables.
  - 13 transmembrane currents.
  - Intracellular calcium handling includes single-compartment SR, buffering.
  - No other intracellular concentrations.
- Hund-Rudy, 2004:
  - 30 variables.
  - 14 transmembrane currents.
  - Intracellular calcium handling includes two-compartment SR, buffering, subspace, CaMKII autophosphorylation.
  - Intracellular Na+, K+, Cl- concentrations.

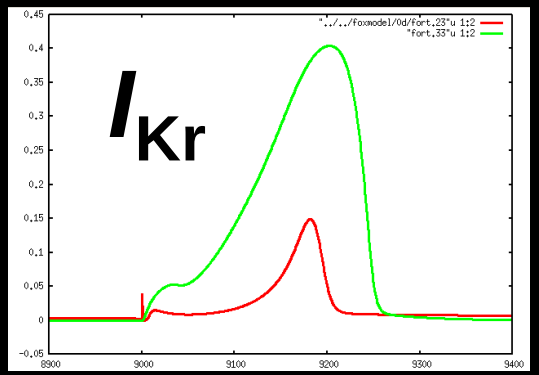
Fox JJ, McHarg JL, Gilmour RF. Am J Physiol Heart Circ Physiol 2002; 282: H516-H530.
Hund TJ, Rudy Y. Circulation 2004; 110: 3168-3174.

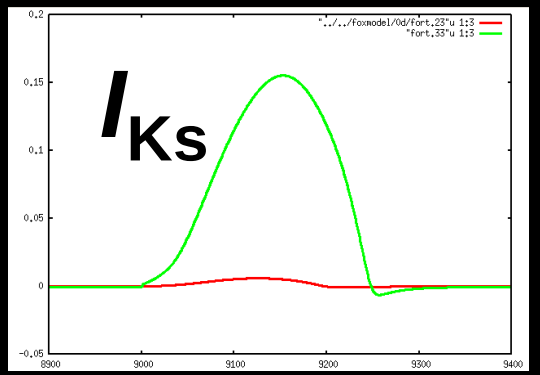
Cellular Dynamics

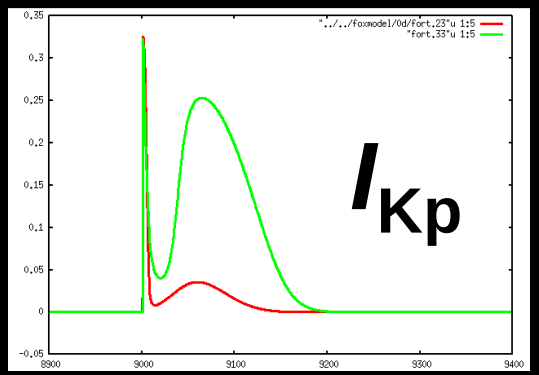


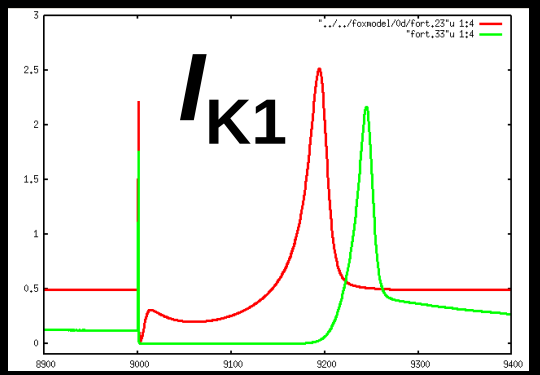








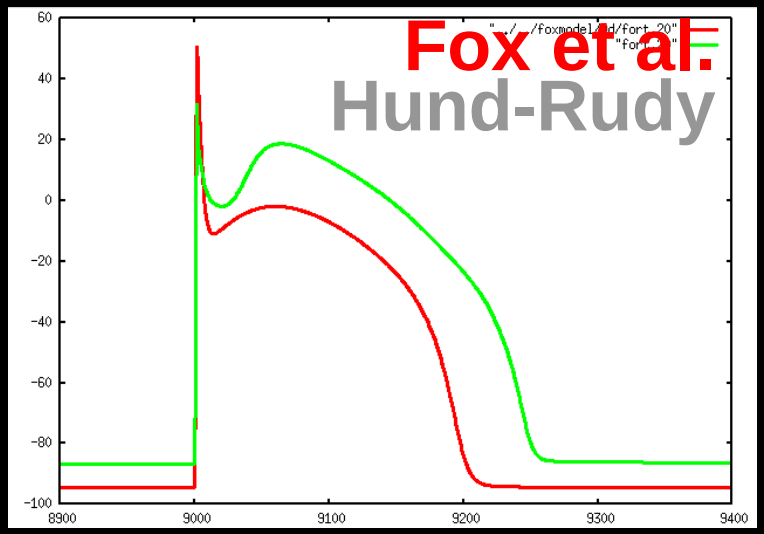


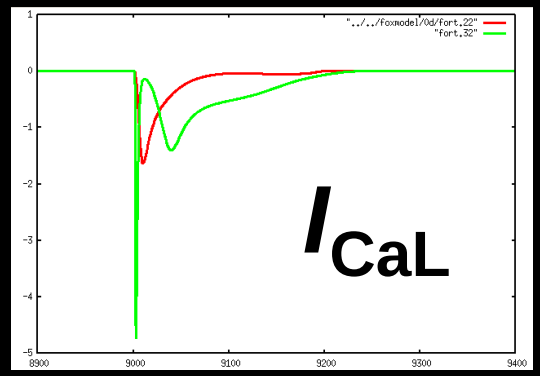


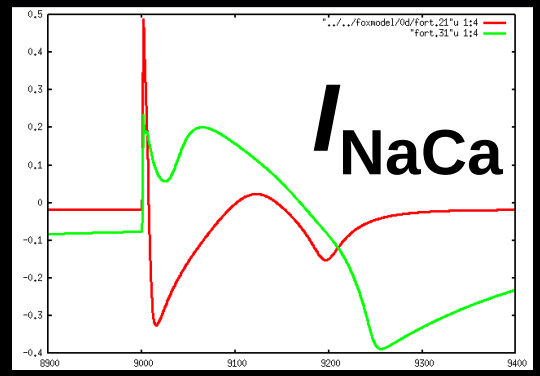
Fox et al.: larger amplitude (145 vs. 107mV), with smaller RMP (-95 vs. -87mV) and larger peak voltage (50 vs. 30mV).

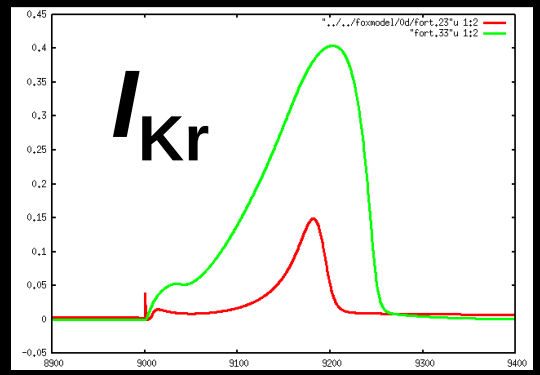
Hund-Rudy: more pronounced notch, longer AP.

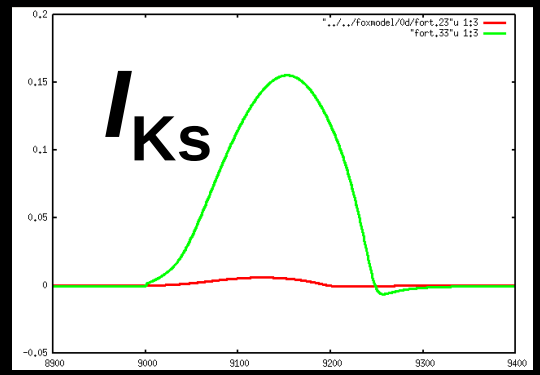
Cellular Dynamics



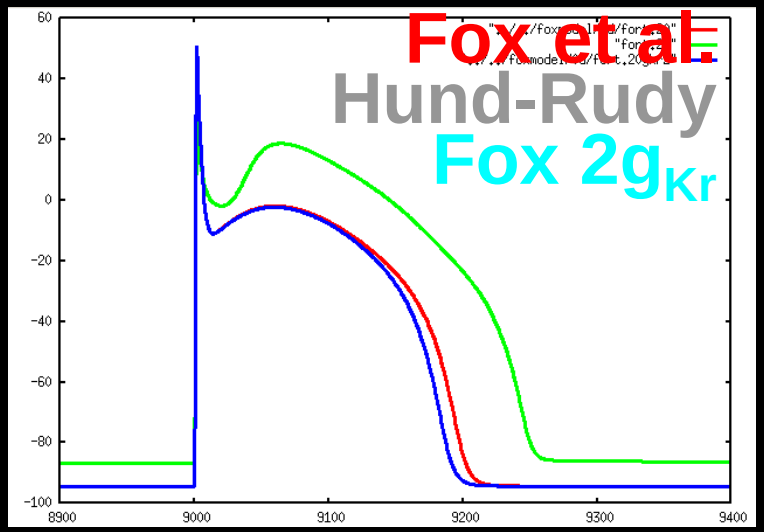


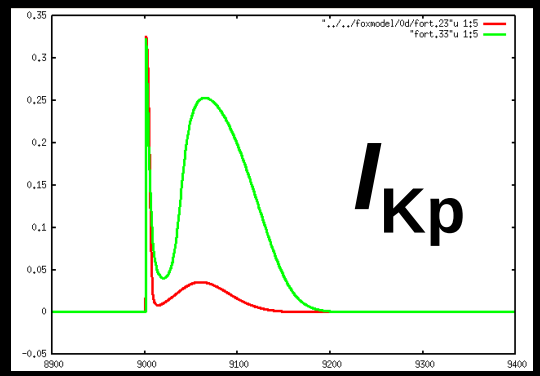


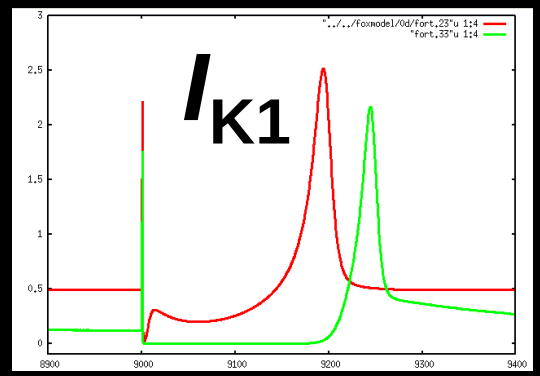




Increased I_{Kr} suppresses alternans.

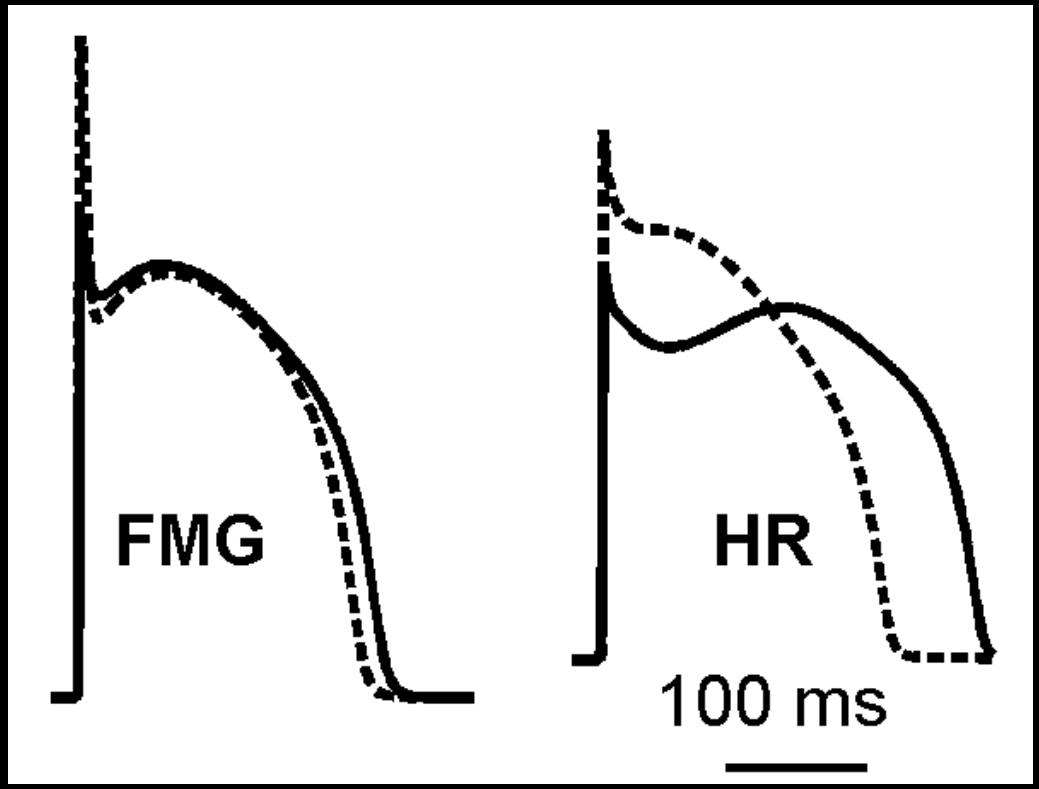






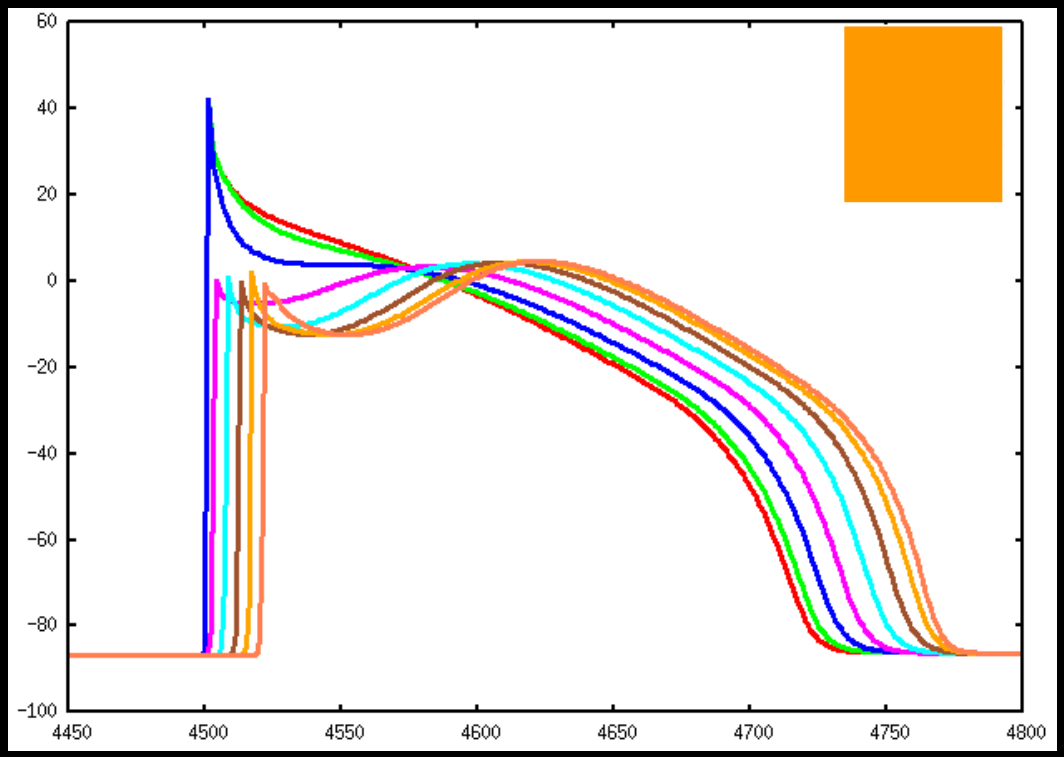
AP Morphology Changes in Tissue

- Action potentials in the Hund-Rudy model decrease in amplitude and *substantially change morphology* in tissue.

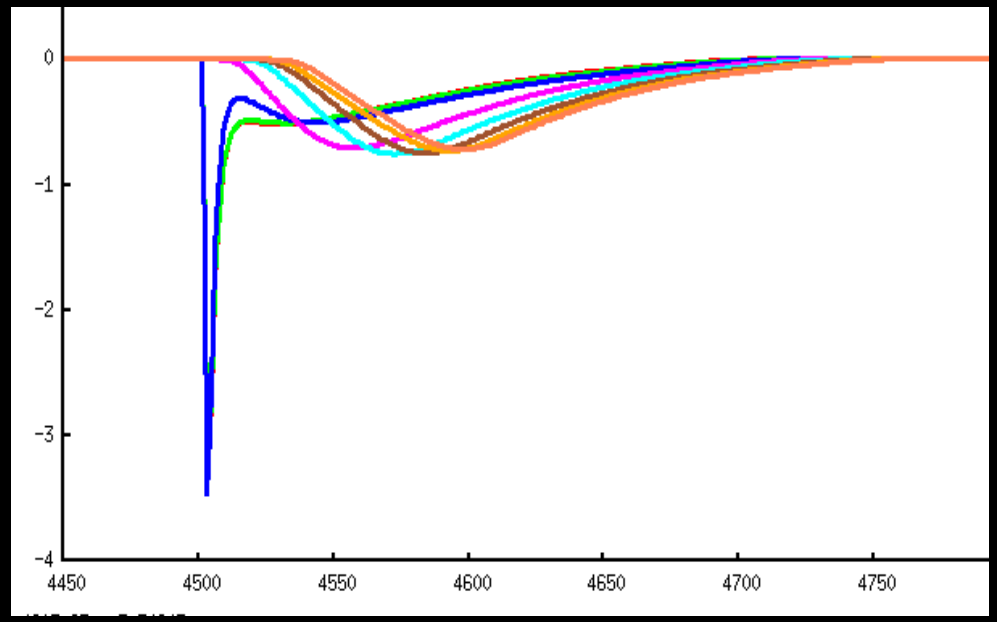


AP Morphology Changes in Tissue

- Action potentials in the Hund-Rudy model decrease in amplitude and *substantially change morphology* in tissue.

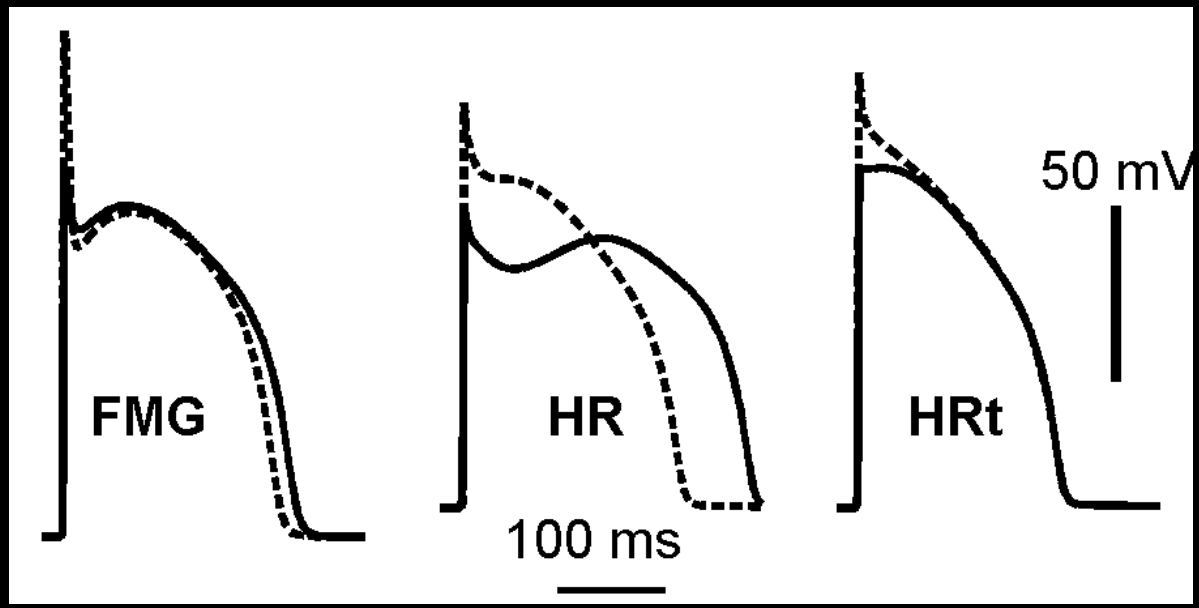


L-type Ca^{2+} current may be responsible!



HRt Model

- Hund-Rudy tissue model (HRt) restores L-type calcium current by increasing AP amplitude.



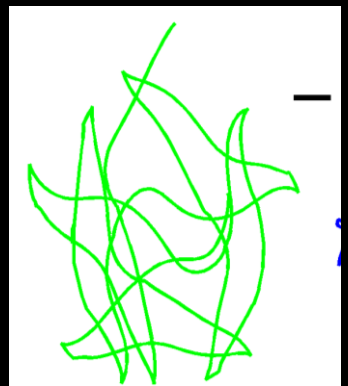
Spiral Waves in 2D

- Stable spirals.
- Similar tip trajectories.
- Hund-Rudy meanders more strongly.

Fox et al.

Hund-Rudy

18x18cm
Period: ~169 ms



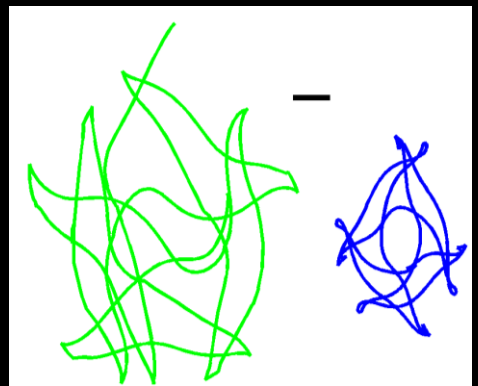
15x15cm
Period: ~120 ms

Spiral Waves in 2D

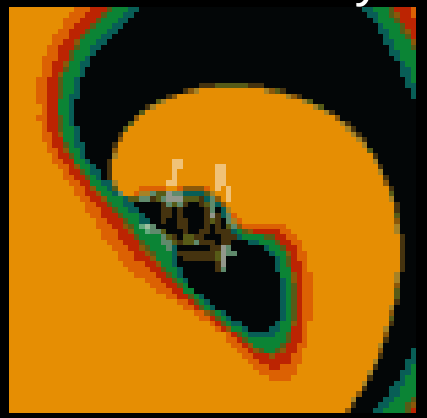
- Stable spirals.
- Similar tip trajectories.
- Hund-Rudy meanders more strongly.

Fox et al.

18x18cm
Period: ~169 ms



Hund-Rudy



15x15cm
Period: ~120 ms

Summary

- Good news:
  - Both models have similar CV restitution and max CV.
  - Both models have similar linear spiral trajectories in 2D.
  - Similar DI_{min}.
- Bad news: two different beasts!
  - Different alternans CL ranges, onset CLs.
  - Different values of dv/dt_{max}.
  - Different spiral periods.
  - Both CV restitutions are unrealistically flat.
  - Pronounced differences in AP morphology in tissue for Hund-Rudy model.
  - Spiral stability can depend on initial conditions.

Mathematical Model

All cardiac cell models in tissue are reaction-diffusion equations.

$$C_{\mathrm{m}} \frac{\partial V(t,\mathbf{x})}{\partial t} = \nabla \cdot (D(\mathbf{x}) \nabla V) - I_{\mathrm{ion}}(V,\mathbf{m}) - I_{\mathrm{stim}}(t,\mathbf{x})$$

$$\frac{\partial \mathbf{m}(t,\mathbf{x})}{\partial t} = \mathbf{f}(V,\mathbf{m})$$

$V(t,\mathbf{x})$ membrane potential

$\mathbf{m}(t,\mathbf{x})$ gating, concentrations

C_{m} membrane capacitance

$D(\mathbf{x})$ conductivity tensor

I_{ion} total ionic current ($I_{Na}+I_K+I_{Ca}$)

I_{ion} external stimulus current

We will describe now the 3V and 4V models (FK-models)

3V Cell Model Equations

Example: a simple 3 current phenomenological model.

The model consists of 3 variables: the membrane voltage **V**, a fast ionic gate **v**, and a slow ionic gate **w**.

The variables are used to produce 3 independent phenomenological ionic currents.

$$
\begin{aligned}
I_{fi}(V;\mathbf{v}) &= -\mathbf{v}\, p\,(V-V_c)(V-V_m)/\tau_d \\
I_{so}(V) &= (V-V_o)\,(1-p)/\tau_o + p/\tau_r \\
I_{si}(V;\mathbf{w}) &= -\mathbf{w}\,\left(1+\tanh\left[k\,(V-V_c^{si})\right]\right)/(2\tau_{si})
\end{aligned}
$$

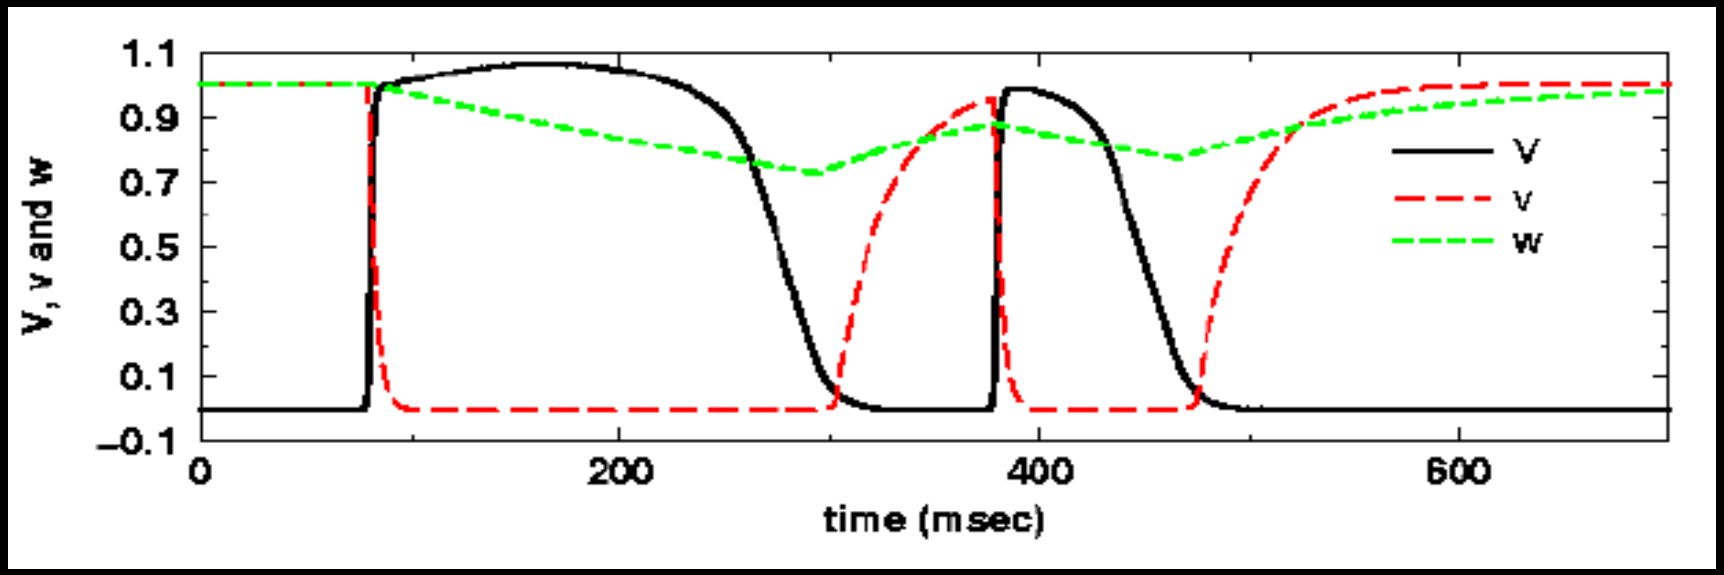
3V Cell Model Equations

The equations for the 3 variables are:

$$\begin{aligned} \partial_t V(\vec{x},t) &= \nabla\cdot(\tilde{D}\nabla V) - I_{\text{ion}} \\ \partial_t \mathbf{v}(t) &= (1-p)\,(1-\mathbf{v})/\tau_{\mathbf{v}}^{-}(V) \;-\; p\,\mathbf{v}/\tau_{\mathbf{v}}^{+} \\ \partial_t \mathbf{w}(t) &= (1-p)\,(1-\mathbf{w})/\tau_{\mathbf{w}}^{-} \;-\; p\,\mathbf{w}/\tau_{\mathbf{w}}^{+} \end{aligned}$$

where $\tau_{\mathbf{v}}^{-}(V) = (1-q)\,\tau_{\mathbf{v}1}^{-} + q\,\tau_{\mathbf{v}2}^{-}$

$$p = \begin{cases} 1 & \text{if } V \geq V_c \\ 0 & \text{if } V < V_c \end{cases} \quad \text{and} \quad q = \begin{cases} 1 & \text{if } V \geq V_{\mathbf{v}} \\ 0 & \text{if } V < V_{\mathbf{v}} \end{cases}$$



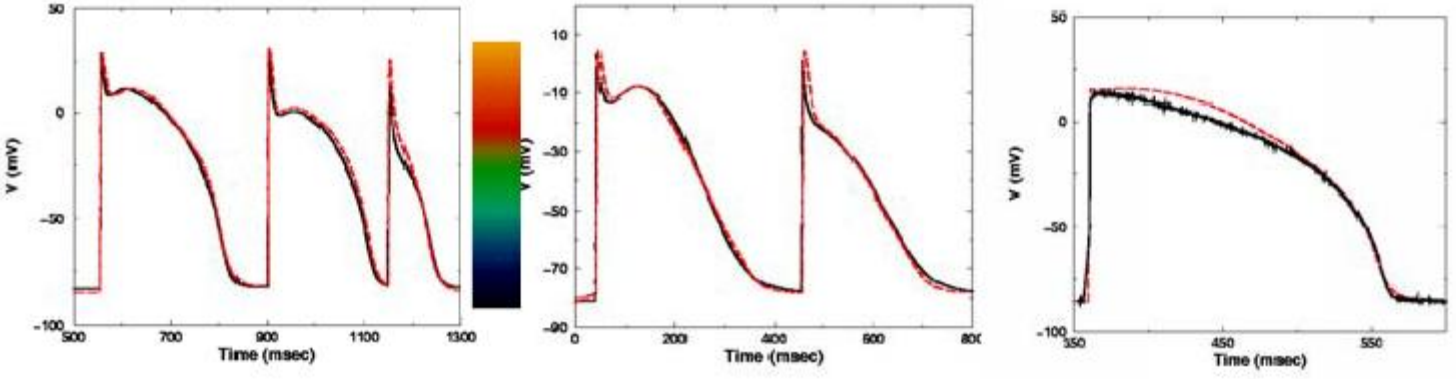
Comparison with Other Models

The equations for the 3 variables are:

$$\begin{aligned}
\partial_t V(\vec{x},t) &= \nabla\cdot(\tilde{D}\nabla V) - I_{\text{ion}} \\
\partial_t \mathbf{v}(t) &= (1-p)\,(1-\mathbf{v})/\tau_{\mathbf{v}}^{-}(V) \;-\; p\,\mathbf{v}/\tau_{\mathbf{v}}^{+} \\
\partial_t \mathbf{w}(t) &= (1-p)\,(1-\mathbf{w})/\tau_{\mathbf{w}}^{-} \;-\; p\,\mathbf{w}/\tau_{\mathbf{w}}^{+}
\end{aligned}$$

where $\tau_{\mathbf{v}}^{-}(V) = (1-q)\,\tau_{\mathbf{v}1}^{-} + q\,\tau_{\mathbf{v}2}^{-}$

$$p = \begin{cases} 1 & \text{if } V \geq V_c \\ 0 & \text{if } V < V_c \end{cases} \quad \text{and} \quad q = \begin{cases} 1 & \text{if } V \geq V_{\mathbf{v}} \\ 0 & \text{if } V < V_{\mathbf{v}} \end{cases}$$



Beeler-Reuter Courtemanche Rabbit experiment

4V Cell Model Equations

$$\partial_t u = \nabla(\tilde{D}\nabla u) - (J_{fi} + J_{so} + J_{si}) \quad (1)$$
$$\partial_t v = (1-m)(v_\infty - v)/\tau_v^- - mv/\tau_v^+ \quad (2)$$
$$\partial_t w = (1-p)(w_\infty - w)/\tau_w^- - pw/\tau_w^+ \quad (3)$$

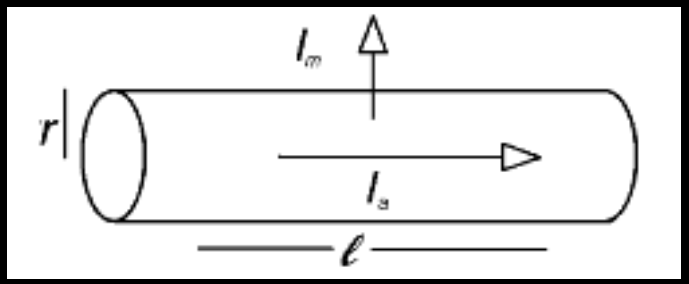
Neumann boundary conditions on potential V:

$$n\cdot\nabla V = 0$$

How to couple cardiac cells to represent tissue?

The Cable Equation



I_membrane
I_axial

$$I_m 2\pi r l = [I_a(x+l) - I_a(x)]\pi r^2 \approx -\left(\frac{\partial i_a}{\partial x}\right)\pi l r^2 \quad (1)$$

Any cahnge on the axial current, produces a change on the membrane current.

$$\left(\frac{\partial V_m}{\partial x}\right) = -\rho i_a \quad (2)$$

The flow of current along the cable is proportional to the voltage gradient (Ohm's law).

Q = CV ; dQ_m/dt = I_m = C dV_m/dt and I_m = I_c + I_ion

$$I_m = I_c + I_{ion} = C_m\left(\frac{\partial V_m}{\partial t}\right) + I_{ion} \quad (3)$$

Combinando Eq 1,2 y 3 obtenemos:

$$\left(\frac{\partial V_m}{\partial t}\right) = r\left(\frac{\partial^2 V_m/\partial x^2}{2\rho C_m}\right) - \frac{I_{ion}}{C_m} = D\left(\frac{\partial^2 V_m}{\partial x^2}\right) - \frac{I_{ion}}{C_m} \quad (4)$$

Fenton et al.
BioSystems 64 (2002) 73–96

Cardiac tissue modeling

Nonlinear parabolic reaction-diffusion equations:

$$C_{\mathrm{m}}\partial_t V(t,\mathbf{x}) = \nabla\cdot(D(\mathbf{x})\nabla V) - I_{\mathrm{ion}}(V,\mathbf{m}) - I_{\mathrm{stim}}(t,\mathbf{x})$$
$$\partial_t \mathbf{m}(t,\mathbf{x}) = \mathbf{f}(V,\mathbf{m})$$

$$\left(\frac{\partial V_{\mathrm{m}}}{\partial t}\right) = r\left(\frac{\partial^2 V_{\mathrm{m}}/\partial x^2}{2\rho C_{\mathrm{m}}}\right) - \frac{I_{\mathrm{ion}}}{C_{\mathrm{m}}} = D\left(\frac{\partial^2 V_{\mathrm{m}}}{\partial x^2}\right) - \frac{I_{\mathrm{ion}}}{C_{\mathrm{m}}} \quad (4)$$

Como resolver estas equaciones Numericamente?

$$\frac{\partial V}{\partial t} = \frac{\partial^2 V}{\partial x^2} + (a - V)(V - 1)V - v$$

$$\frac{\partial v}{\partial t} = \epsilon(\beta V - \gamma v - \delta)$$

$$\left(\frac{\partial V_m}{\partial t}\right) = r\left(\frac{\partial^2 V_m / \partial x^2}{2\rho C_m}\right) - \frac{I_{ion}}{C_m} = D\left(\frac{\partial^2 V_m}{\partial x^2}\right) - \frac{I_{ion}}{C_m} \quad (4)$$

Integration

- Given an ODE, $\frac{\mathrm{d}V}{\mathrm{d}t} = f(V)$

  we can develop an integration method to evolve the solution in time using Taylor series:

$$V(t+\Delta t) = V(t) + \Delta t \frac{\mathrm{d}V(t)}{\mathrm{d}t} + \frac{\Delta t^2}{2} \frac{\mathrm{d}^2 V(t)}{\mathrm{d}t^2} + O\left(\Delta t^3\right)$$

- A first-order approximation of the derivative can be obtained as:

$$\frac{V(t+\Delta t) - V(t)}{\Delta t} = \frac{\mathrm{d}V(t)}{\mathrm{d}t} + O\left(\Delta t\right)$$

Integration

- Thus, for simplicity, we can approximate the derivative to first order as

$$\frac{V(t+\Delta t)-V(t)}{\Delta t}=\frac{\mathrm{d}V}{\mathrm{d}t}=f(V)$$

$$V(t+\Delta t)=V(t)+\Delta t\ f(V)$$

- We can represent V(t) as V^i and V(t+Δt) as V^{i+1}. Then

$$V^{i+1}=V^i+\Delta t\ f(V)$$

- Note that we need to begin with an initial condition V^0 (usually resting membrane potential).

Integration in Tissue

- In tissue, the equation of interest includes a spatial derivative:

$$\frac{\mathrm{d}V(x,t)}{\mathrm{d}t} = f\big(V(x,t)\big) + D\frac{\partial^2 V(x,t)}{\partial x^2}$$

- In this case we also need an approximation for the spatial derivative.

Integration in Tissue

- In this case we combine the following:

$$V(x+\Delta x,t)=V(x,t)+\Delta x\frac{\partial V(x,t)}{\partial x}+\frac{\Delta x^2}{2}\frac{\partial^2 V(x,t)}{\partial x^2}+O\left(\Delta x^3\right)$$

$$V(x-\Delta x,t)=V(x,t)-\Delta x\frac{\partial V(x,t)}{\partial x}+\frac{\Delta x^2}{2}\frac{\partial^2 V(x,t)}{\partial x^2}-O\left(\Delta x^3\right)$$

- Summing, we get the following:

$$V(x+\Delta x,t)+V(x-\Delta x,t)=2V(x,t)+\Delta x^2\frac{\partial^2 V(x,t)}{\partial x^2}-O\left(\Delta x^4\right)$$

- and to second order

$$\frac{\partial^2 V(x,t)}{\partial x^2}=\frac{V(x+\Delta x,t)-2V(x,t)+V(x-\Delta x,t)}{\Delta x^2}$$

Integration in Tissue

- We can use the following approximation to advance the solution in time (first order in time, second order in space):

$$V_i^{n+1} = V_i^n + \Delta t\, f(V_i^n) + \frac{\Delta t}{\Delta x^2}\left(V_{i+1}^n - 2V_i^n + V_{i-1}^n\right)$$

  where V_i^n represents the i^{th} point in space and the n^{th} time step.

- Note that now we need both an initial condition V(x,0) and boundary conditions V(0,t), e.g.

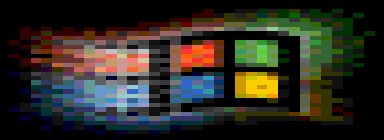
$$\frac{\partial V(0,t)}{\partial x} = 0, \quad \frac{\partial V(L_x,t)}{\partial x} = 0$$

Simulations in 1D (FHN-model)

http://thevirtualheart.org/java/fhn1d.html

Simulations in 2D (FHN-model)

http://thevirtualheart.org/java/2dfhn.html



3V Cell Model Equations

The model consists of 3 variables: the membrane voltage **v**, a fast ionic gate **v**, and a slow ionic gate **w**.

$$
\begin{aligned}
I_{fi}(V;\mathbf{v}) &= -\mathbf{v}\, p\,(V-V_c)(V-V_m)/\tau_d \\
I_{so}(V) &= (V-V_o)\,(1-p)/\tau_o + p/\tau_r \\
I_{si}(V;\mathbf{w}) &= -\mathbf{w}\,\left(1+\tanh\left[k\,(V-V_c^{si})\right]\right)/(2\tau_{si})
\end{aligned}
$$

$$
\frac{\partial V}{\partial t} = \frac{\partial^2 V}{\partial x^2} + (a-V)(V-1)V - v
$$

$$
\frac{\partial v}{\partial t} = \epsilon(\beta V - \gamma v - \delta)
$$

The equations for the 3 variables are:

$$
\begin{aligned}
\partial_t V(\vec{x},t) &= \nabla\cdot(\tilde{D}\nabla V) - I_{\text{ion}} \\
\partial_t \mathbf{v}(t) &= (1-p)\,(1-\mathbf{v})/\tau_{\mathbf{v}}^{-}(V) - p\,\mathbf{v}/\tau_{\mathbf{v}}^{+} \\
\partial_t \mathbf{w}(t) &= (1-p)\,(1-\mathbf{w})/\tau_{\mathbf{w}}^{-} - p\,\mathbf{w}/\tau_{\mathbf{w}}^{+}
\end{aligned}
$$

where $\tau_{\mathbf{v}}^{-}(V) = (1-q)\,\tau_{\mathbf{v}1}^{-} + q\,\tau_{\mathbf{v}2}^{-}$

$$
p = \begin{cases} 1 & \text{if } V \geq V_c \\ 0 & \text{if } V < V_c \end{cases}
\quad \text{and} \quad
q = \begin{cases} 1 & \text{if } V \geq V_{\mathbf{v}} \\ 0 & \text{if } V < V_{\mathbf{v}} \end{cases}
$$

3V Cell Model Equations
